Good First Issue Finder

Finding beginner issues across the whole result set

Building with IBM Bob · Explore, Fix, and Build

Yusuf Abdinoor | October 2026

The original search missed real matches

The app loaded 10 issues at a time. Title and label filters checked only the issues already in the browser.

Before

A later-page match could appear as “no issues found.”

Example: “Cupcake Ipsum” was outside the initial 10 results.

Bob helped trace and repair the query flow

Bob explored the unfamiliar SvelteKit app, followed pagination and search through the API, then implemented server-side title search and a language filter.

We also moved label filtering into GitHub search, allowed labels beyond first-page suggestions, and reset pagination when filters change.

Working result and next steps

After

“Cupcake Ipsum” returns the matching issue. A typed “hacktoberfest” label finds matches beyond the first page.

42 unit tests pass. Svelte check: 0 errors, 0 warnings. The site is deployed on Vercel.

Roadmap: surface issue freshness, improve pagination, and update upstream dependencies.
